4. Configuring the System 31

Release Notes
SCO™ International UNIX System V/386
Operating System Release 3.2
and
SCO UNIX System V/386
Operating System
International Supplement Release 3.2
For Industry Standard Computers
10th July 1989

1. Preface

This document contains important information about the SCO International UNIX System V/386 Operating System Release 3.2 and SCO UNIX System V/386 Operating System International Supplement Release 3.2:

- Installation Notes
- Installation Procedure
- Internationalization Software Notes
- Compatible Hardware

Note

Please read through the entire document before installing the SCO UNIX System V/386 Operating System International Supplement.

International UNIX Supplement

SCO is always pleased to hear of users' experiences with our product, and recommendations of how it can be made even more useful. All written suggestions are given serious consideration.

1.1 Contents of the International Operating System

The International UNIX System V/386 Operating System includes the complete SCO UNIX System V/386 Operating System Release 3.2 distribution:

- SCO UNIX System V/386 Installation Guide
- SCO UNIX System V/386 System Administrator's Guide
- Introduction to UNIX
- SCO UNIX System V/386 User's Guide
- SCO UNIX System V/386 User's Reference Manual
- SCO UNIX System V/386 Release Notes
- These SCO UNIX System V/386 International Supplement Release Notes
- SCO UNIX System V/386 International Operating System Guide
- Installation and boot diskettes
- Basic Utility Diskettes
- Games Diskette
- SCO UNIX System V/386 Operating System International Supplement diskettes

International Operating System Release Notes

1.1.1 Diskette Volumes in This Distribution

The diskette volume numbers are found in the SCO UNIX System V/386 Operating System Release 3.2 *Release Notes*.

1.2 Contents of the OS International Supplement

The SCO UNIX System V/386 Operating System International Supplement includes the following:

- SCO UNIX System V/386 Operating System International Supplement Release and Installation Notes
- SCO UNIX System V/386 International Operating System Guide
- SCO UNIX System V/386 Operating System International Supplement diskettes

1.2.1 Files in this Set

The SCO UNIX System V/386 Operating System International Supplement distribution media contains the files listed below. Other files, for performing installation and initialization, may also be included in the distribution.

/bin/cat
/bin/cmp
/bin/date
/bin/dd
/bin/diff
/bin/echo
/bin/ed

International UNIX Supplement

/bin/egrep
/bin/env
/bin/expr
/bin/fgrep
/bin/file
/bin/find
/bin/fsck
/bin/grep
/bin/head
/bin/login
/bin/lsh
/bin/ncheck
/bin/pg
/bin/pr
/bin/printenv
/bin/red
/bin/rmdir
/bin/sed
/bin/sh8
/bin/sort
/bin/tail
/bin/tee
/bin/tr
/bin/wall
/bin/wc
/bin/who
/bin/write
/bin/xbackup
/bin/xdump
/bin/xdumpdir
/bin/xrestor
/bin/xrestore
/bin/xsddate

International Operating System Release Notes

2. Important Notes About Installation

The SCO UNIX System V/386 Operating System International Supplement requires release 3.2 of the SCO UNIX System V/386 Operating System.

Because the International Supplement is adding to or modifying the SCO UNIX System V/386 Operating System, please note the following:

- The supplement must be installed in single-user (System Maintenance) mode. The installation script will warn you if this is attempted while other users are still on the system.
- When **custom** lists the packages currently installed on your system, some of the International Supplement packages will register as fully or partly installed, despite the fact that you have not yet installed them. This is because there are 7-bit utilities from the standard operating system already in place and it is these that are shown as installed.
- If you do not have the MAPCHAN package currently installed, you will be asked to insert diskettes from the UNIX Operating System distribution. Make sure you have these diskettes to hand.

International UNIX Supplement

3. Installation Procedure

This section explains how to install the SCO UNIX System V/386 Operating System International Supplement on a computer currently running UNIX. After the installation, configure your system to suit your hardware and language environment.

In order to understand the concepts of the installation, please read through this entire document before installing the SCO UNIX System V/386 Operating System International Supplement.

The installation instructions in this section are for all distributions (96 and 135 tpi). Each distribution contains a different number of volumes, but the steps are the same for all distributions. Just follow the instructions on the screen to insert the next disk when prompted.

In order to use the International Supplement you must have release 3.2 of the SCO UNIX System V/386 Operating System installed on your computer.

If this Supplement was purchased as part of the International UNIX System V/386 Operating System, perform the UNIX Operating System installation described in Chapter 2 of the *SCO UNIX System V/386 Installation Guide* before continuing with this section.

To install the SCO UNIX System V/386 Operating System International Supplement, follow the instructions below. If you encounter a problem while using **custom(C)**, press the <Return> key to continue.

1. Halt the system, reboot and enter single-user (System Maintenance) mode. Type **custom**, and press <Return>.
2. The system displays the main custom menu, which offers options to install, remove, list and quit. The menu also lists the products currently installed on your system:

International Operating System Release Notes

Products Currently installed

The Operating System
The Development System
The Text Processing System

The software list on your screen is probably different from the one shown above. Use the arrow keys to highlight *Install* and press <Return>.

3. The Install screen appears:

Select a product : []

Choose a type : [Entire Product] Packages Files

The Install screen also shows a list of software:

*A New Product
The Operating System
The Development System
The Text Processing System

Again, your software list might look different. If you are installing the International Supplement for the first time, select *A New Product* and press <Return>.

If you are re-installing, an extra option is offered specifically for re-installation. Select the option, *SCO UNIX System V/386 O.S. International Supplement*.

4. The install screen offers the choice of installing the *Entire Product*, *Packages* or *Files*:

International UNIX Supplement

Select a product : [A New Product]

Choose a type : Entire Product Packages Files

You are most likely to want to install the complete International UNIX OS Supplement. To do so, select *Entire Product* and press <Return>.

If you wish to select from a choice of packages select *Packages* and press <Return>.

5. Next, the Install screen directs you to insert SCO UNIX System V/386 Operating System International Supplement volume 1:

Insert the requested volume and press <Return> to continue the installation

Insert : Distribution

Volume : 1

Insert the proper volume and press <Return> to continue. The message "Installing custom data files..." appears at the top of the Install screen.

International Operating System Release Notes

6. The screen clears and the message "Executing Product Prep Script" is displayed. Press any key to continue the installation.

If you are installing the International Supplement for multi-user, the following message is displayed:

The Operating System Supplement should be installed in single-user ("System Maintenance") mode. Otherwise, unpredictable failures may occur during installation.

Are you absolutely sure you wish to install in multi-user mode? (y/n)

You are advised to answer "n" to the prompt above. The system will break out of **custom** for you to re-install the International Supplement from step 1.

If you decide to continue in multi-user mode by pressing "y", you may receive errors later in the installation.

International UNIX Supplement

7. If you selected *Packages* from the screen offering package types, a list of the SCO UNIX System V/386 Operating System International Supplement packages is displayed for you to choose from.

Information about the packages is displayed in four columns: the name of the package is displayed first, followed by whether the package is partly or fully installed, followed by the size of the package and a description of the package:

ALL	Part	7554	Complete International UNIX O.S. Supplement
RTSUP	Part	3032	Supplement to UNIX Run Time System
BASE	Part	1180	Supplement to basic extended utility set
BACKUP	Part	272	Supplement to system backup and recovery tools
SYSADM	Part	150	Supplement to system administration tools
FILE	Part	250	Supplement to file manipulation tools
MAIL	Part	506	Supplement to mail and networking
EX	Part	454	Terminfo Files
MAPFILE	Part	1218	ISO 8859 mapchan files
FONT	Part	142	Font files for international character sets

Note that *Size* (third column) in the above display, may vary from release to release.

Also note that selecting *ALL* is the same as if you had selected *Entire Package* from the screen offering package types.

International Operating System Release Notes

If you installed the SCO UNIX System V/386 Operating System, you will notice that the table above, is very similar to the one displayed by **custom** during the operating system installation.

Some packages can be installed only if the corresponding standard product package has been installed already. If the standard product package is re-installed for any reason, the corresponding International Supplement package must be re-installed, also. This is because the package will have been overwritten by the standard one.

Note

MAPFILE adds a number of files which allow filtering of characters, both on input and output, using the **mapchan(M)** utility. Thus, a uniform and transparent interface is presented to the user.

FONT adds a number of files which can be used with the **vidi(C)** utility. They provide new console character sets to support alternative national language characters.

Highlight the line corresponding to the SCO UNIX System V/386 Operating System International Supplement packages you wish to install, and press <Space> to select. Then press <Return>. The message "Creating file lists..." appears at the top of the Install screen.

8. Again, the system instructs you to insert volume 1, which should still be in the drive. Press <Return>.

The message "Extracting files" appears and remains on the screen as long as **custom** is extracting SCO UNIX System V/386 Operating System International Supplement packages from the disk. If this release of the International

International UNIX Supplement

Supplement has more than one volume, you are asked to load each additional volume in turn.

A list of the distribution-media files is included in the section "Files in this Set", of this document.

9. If you selected the RTSUP package, the following message is displayed after the RESTRICTED RIGHTS LEGEND:

SCO UNIX System V/386 O.S. International Supplement Serialization

Enter your serial number or enter q to quit:

Enter your activation key or enter q to quit:

Enter your serial number and activation key.

10. If you selected the RTSUP package, you will see the line:

System-wide locale initialization

The current settings will be printed. The first is the default locale, if no **LANG** environment variable is defined. Subsequent lines are the per-language defaults for the territory and code set, if a **LANG** environment variable is set to a language only.

International Operating System Release Notes

You will then see the line:

Do you wish to change these default locale settings? (y/n)

If you select "y", the message "Reading locale information ... Available locales are:" is displayed and you are presented with a list of the currently available locales. Choose an entry for the primary default:

Please enter your choice for the primary default [1 - n]
or enter q to quit

You will then be asked if you wish to add defaults for other languages. If you answer yes, you will again be presented with a list of available locales. You can select any number of per-language defaults.

When you have selected as many locales as you need, press "q". You will see the message:

Default locale selection complete.

International UNIX Supplement

11. If you selected the BASE package, the following message is displayed:

Configuring Keyboards

Please refer to the table of available keyboard files in the Release and Installation Notes.

You will then see a message:

Do you wish to have a keyboard map automatically
selected during system startup? (y/n)

If you select “y”, you will then see the message:

Enter the option number for your keyboard type [1-49] or
type ‘q’ to quit:

Select a keyboard type from the table below and enter the appropriate number.

International Operating System Release Notes

PS/2[™] style keyboards (with the display character ROM type in parentheses if this is not IBM[®]):

1. American
2. United Kingdom
3. German
4. Swiss German
5. Swiss French
6. French
7. Belgian
8. Portuguese (portuguese)
9. Spanish (Spanish)
10. Spanish International
11. Italian
12. Greek with Greek characters as default (Greek)
13. Greek with ASCII characters as default (Greek)
14. Danish (Norwegian)
15. Norwegian (Norwegian)
16. Swedish

PC-AT style keyboards:

17. American
18. United Kingdom
19. German
20. French
21. Spanish
22. Italian

International UNIX Supplement

PC-AT style keyboards on a system using
ISO8859 mapchan:

- 23. American
- 24. United Kingdom
- 25. German
- 26. Swiss German
- 27. Swiss French
- 28. French
- 29. Spanish
- 30. Italian
- 31. Norwegian
- 32. Swedish

PS/2 style keyboards using codepage 850:

- 33. American
- 34. United Kingdom
- 35. German
- 36. Swiss German
- 37. Swiss French
- 38. French
- 39. Belgian
- 40. Portuguese
- 41. Spanish
- 42. Italian
- 43. Danish
- 44. Norwegian
- 45. Swedish
- 46. Finnish
- 47. Canadian
- 48. Latin Spanish
- 49. Dutch

International Operating System Release Notes

If you enter a valid option number, you will see the message:

Preserving ./usr/lib/keyboard/keys as ./usr/lib/keyboard/keys.old

Your keyboard will be mapped with the chosen option.

12. If you selected the MAPFILE package and the MAPCHAN package is partially installed or not installed at all, you are now prompted to install MAPCHAN:

International Character set mapping is not installed.

Do you wish to install it now? (y/n)

OR

International Character set mapping is only partially installed.

Do you wish to install it now? (y/n)

The MAPCHAN package must be installed so that the channel mapping features of the International Supplement can be used. Select "y", unless you do not wish to use channel mapping for peripheral devices. If you select "y" you are prompted for volumes from the Operating System distribution.

International UNIX Supplement

13. If you selected the MAPFILE package, you see the message:

The following procedure should be selected if you intend to use the ISO 8859 internal character set, which is recommended. If you wish to configure your own channel maps, or leave in place maps which you have already configured, reply 'n' to the next question:

Do you wish to configure automatic character set mapping? (y/n)

Note

If you have a Greek PS/2 style keyboard you can also configure automatic character set mapping by entering "y" to the above question. The character set used for Greek does not conform to the ISO 8859 character set.

Unless you are re-installing the International Supplement, (or don't require mapping) you should select "y" at the prompt. If you enter "n", proceed to Step 14.

International Operating System Release Notes

You will then see a message describing the next steps in configuring mapchan files, followed by a list of available tty lines and the following prompt:

Please enter a mapchan file type to assign to one or more of these terminals [1-69] or enter q to quit:

You should select a mapchan file type from the following table, or answer "q" if you wish to set them all to a common type.

1. 7-bit ASCII
2. HP[®] Laser Jet ROMAN-8
3. Console with PC character ROM
4. Console with ISO 8859 ROM
5. Console with PC Nordic ROM
6. Console with PC Portuguese ROM
7. Console with PC Spanish National ROM
8. Console with PC Greek ROM
9. Console with IBM PC 850 Multilingual code paging
10. 7-bit French Canadian NRC
11. 7-bit Swiss German NRC
12. 7-bit French NRC (NFZ62-101 1982)
13. 7-bit German NRC (DIN66003)
14. 7-bit Italian NRC
15. 7-bit Norwegian NRC
16. 7-bit Spanish NRC
17. 7-bit Swedish NRC
18. 7-bit UK English NRC (BS4730)
19. Qume[®] French NRC

- 68. HP ROMAN 8-bit
- 69. Other

You will then see:

Please enter serial lines to map as *your choice* or
enter 'q' to quit.

Enter, on one line separated by a space, the ttys you wish to have mapped by the selected mapchan file type.

International UNIX Supplement

You can now repeat this for another mapchan file type, or answer “q” to the “Please enter a mapchan...” prompt. If there are many ttys unmapped after this stage, you will see the message below, followed by a list of unmapped ttys:

The following serial lines remain unmapped:

You are then prompted:

Do you wish to select a common channel map for all these serial lines? (y/n)

If you answer “y” to this question, you must then answer the following line:

Please enter the mapchan file type for all remaining terminals [1-69] or enter q to quit:

Select one from the table of mapchan file types given earlier in these notes. Note that channel mapping does not come into effect until the system is rebooted.

14. You are returned to the custom menu. The International Supplement is now installed on your system.

International Operating System Release Notes

4. Configuring the System

The installation procedure only configures some basic system requirements. It may also be necessary to modify the configuration to satisfy individual users' needs. Examples of areas which need consideration are:

- Terminals and printers may need to be adjusted. This is both with their own setup procedure and with the correct mapchan files.
- The system needs to be working with a consistent internal character set.
- Users may need to have their environment set, so that date, time, currency and numerical output meets their specific requirements.
- Collation sequences may need to be set so that sorting and use of regular expressions proceeds according to specific requirements.
- If a mixture of 7 and 8-bit software is being used, the users must be aware of how to use both types together.

This is covered in the SCO UNIX System V/386 *International Operating System Guide*. The chapter on "Administering International UNIX" deals with the practical aspects of the above tasks, and the chapter on "Introducing International UNIX" gives more detail on the system.

A.5.1 Additional Information On Supported

A.5.2 Setting up a Terminal A-14

A.A Supported Hardware

A.1 Keyboard Mapping for the Console

mapkey files are supplied for various PS/2 and PC-AT style keyboards and different character sets. The files are held in the directory */usr/lib/keyboard*. Use the following tables to select the appropriate keyboard file for your console:

PS/2 style keyboard	ROM or vidi(C) font							
	PC Standard ibm	PC HP 850	PC Nordic nor	PC Portuguese por	PC Spanish spa	PC Greek grk		
Belgian	ps.ibm.bel	ps.850.bel	ps.nor.dan	ps.por.por	ps.spa.spa	ps.grk.gra		
Canadian		ps.850.can						
Danish		ps.850.dan						
Dutch		ps.850.ndl						
Finnish		ps.850.fin						
French	ps.ibm.fra	ps.850.fra	ps.nor.nor					
German	ps.ibm.ger	ps.850.ger						
Greek (ASCII def.)								
Greek (Greek def.)								
Italian	ps.ibm.ita	ps.850.ita						
Latin Spanish	ps.ibm.lsp	ps.850.lsp						
Norwegian		ps.850.nor						
Portuguese		ps.850.por						
Spanish								
Spanish Intl.	ps.ibm.spa	ps.850.spa						
Swedish	ps.ibm.swe	ps.850.swe						
Swiss French	ps.ibm.swf	ps.850.swf						
Swiss German	ps.ibm.swg	ps.850.swg						
UK English	ps.ibm.ukd	ps.850.ukd						
USA English	ps.ibm.usa	ps.850.usa						

International UNIX Supplement

PC-AT style Keyboard	ROM or vidi(C) font	
	PC Standard ibm	PC ISO 8859/1 iso
French	at.ibm.fra	at.iso.fra
German	at.ibm.ger	at.iso.ger
Italian	at.ibm.ita	at.iso.ita
Norwegian		at.iso.nor
Spanish	at.ibm.spa	at.iso.spa
Swedish		at.iso.swe
Swiss French		at.iso.swf
Swiss German		at.iso.swg
UK English	at.ibm.ukd	at.iso.ukd
USA English	at.ibm.usa	at.iso.usa

Note that the layout of different manufacturer's keyboards can vary, so some changes may be necessary to these files for correct operation on your system.

Appendix A

A.2 Dead Key Sequences

Six dead keys are supported by the map files provided with the UNIX system. The map files for the following terminals use the specified dead keys. The other map files do not provide dead keys, but can be modified to do so:

File	caret (^)	acute (')	grave (`)	umlaut (")	tilde (~)	cedilla (,)
cons.ibm	X	X	X	X		
cons.nor	X	X	X	X	X	
cons.por	X	X	X	X	X	
cons.spa		X	X	X		
cons.850	X	X	X	X	X	X
cons.grk		X		X		
tvi.fra	X					
wy60.ger		X	X			
wy60.fra.asc	X			X		
wy60.fra.ans	X			X		
w60.ibmfra.ans	X			X		
w60.ibmfra.asc	X			X		
wy60.ibm.ger		X	X			

A.3 Screen Font Mapping for the Console

If you change mapchan mapping for a console with any type of display adapter, you will also need to change the character font.

International UNIX Supplement

The **vidi(C)** utility defines the font for one of the character sets given below. The following font definition files are available in the directory */usr/lib/vidi*:

Character Set	8x8 font	8x14 font	8x16 font
Codepage 850	850.8x8	850.8x14	850.8x16
ISO 8859	iso.8x8	iso.8x14	iso.8x16
PC Greek	grk.8x8	grk.8x14	grk.8x16
PC Israeli	isr.8x8	isr.8x14	isr.8x16
PC Nordic	nor.8x8	nor.8x14	nor.8x16
PC Portuguese	por.8x8	por.8x14	por.8x16
PC Spanish	spa.8x8	spa.8x14	spa.8x16
PC Standard	font.8x8	font.8x14	font.8x16

A.4 Setting up a Printer

mapchan files are specifically supplied for the following devices, although any mapchan file can be used if suitable. All files are in the directory */usr/lib/mapchan*:

File	Device
hp.roman8	Hewlett-Packard LaserJet Printer ROMAN-8 set
ibm	Any printer using the IBM PC character set

A.5 Terminals

The following mapchan files are provided in */usr/lib/mapchan* to permit the use of international character sets on the following terminals:

ascii	Any 7-bit US ASCII terminal
hp.roman8	ROMAN-8, i.e. Hewlett-Packard Laserjet II
cons.ibm	Console-PC standard ROM
cons.iso	Console-ISO 8859/1 ROM
cons.nor	Console-PC Nordic ROM
cons.por	Console-PC Portuguese ROM
cons.spa	Console-PC Spanish ROM
cons.grk	Console-PC Greek ROM
cons.850	Console-IBM PC Multilingual code paging
nrc.can	Canadian 7-bit NRC terminals
nrc.chw	Swiss 7-bit NRC terminals
nrc.fra	French 7-bit NRC terminals
nrc.ger	German 7-bit NRC terminals
nrc.ita	Italian 7-bit NRC terminals
nrc.nor	Norwegian 7-bit NRC terminals
nrc.spa	Spanish 7-bit NRC terminals
nrc.swe	Swedish 7-bit NRC terminals
nrc.ukd	UK English 7-bit NRC terminals
qvt.fra	Qume QVT101 with French keyboard
qvt.ger	Qume QVT101 with German keyboard
tvi.fra	TVI924 with French keyboard
tvi.ger	TVI924 with German keyboard
tvi.nor	TVI924 with Norwegian/Danish keyboard
tvi.por	TVI924 with Portuguese keyboard
tvi.spa	TVI924 with Spanish keyboard
tvi.swe	TVI924 with Swedish/Finnish keyboard
tvi.ukd	TVI924 with UK keyboard
tvi.usa	TVI924 with US ASCII keyboard

International UNIX Supplement

dec	DEC Multinational, i.e. VT220
wy60.fra.ans	Wyse60 French NRC with ANSI keyboard

hp.ansi.7.swi	HP with Swiss German/French ANSI keyboard
hp.ansi.7.ukd	HP with UK English ANSI keyboard
hp.ansi.7.usa	HP with US English ANSI keyboard
hp.ascii.7.bel	HP with Belgian ASCII keyboard
hp.ascii.7.fra	HP with French ASCII keyboard
hp.ascii.7.can	HP with Canadian English/French ASCII keyboard
hp.ascii.7.dan	HP with Danish ASCII keyboard
hp.ascii.7.esp	HP with European Spanish ASCII keyboard
hp.ascii.7.fin	HP with Finnish ASCII keyboard
hp.ascii.7.swe	HP with Swedish ASCII keyboard
hp.ascii.7.ger	HP with German ASCII keyboard
hp.ascii.7.ita	HP with Italian ASCII keyboard
hp.ascii.7.lsp	HP with Latin Spanish ASCII keyboard

Appendix A

hp.ascii.7.ndl	HP with Dutch ASCII keyboard
hp.ascii.7.nor	HP with Norwegian ASCII keyboard
hp.ascii.7.swi	HP with Swiss German/French ASCII keyboard
hp.ascii.7.ukd	HP with UK English ASCII keyboard
hp.ascii.7.usa	HP with US English ASCII keyboard
hp.ansi.8	HP with 8-bit Dec Multinational Character set
hp.roman.8	HP with 8-bit ROMAN Character set

Note

The cons.grk mapchan does not conform to the ISO 8859 standard.

Files which are not designed for specific terminal makes (the *nrc.** files) may need some additions to account for the features of a particular terminal. As a guide, see how the *qvt.** files differ from their corresponding *nrc.** ones.

A.5.1 Additional Information On Supported Terminals

The following terminals are supported with the SCO UNIX System V/386 Operating System International Supplement:

- wyse60
- wyse60n
- ws685
- ws685pc

International UNIX Supplement

The tables below, help you choose which mapchan files to use with different terminals and keyboards.

wyse60

In order to load the correct font for use with 8-bit characters, set your terminal as follows:

wyse60	wyse60 8-bit with ANSI/ASCII keyboard
wyse60n	wyse60n 7-bit NRC with ANSI/ASCII keyboard

The following table gives the mapchan files for different keyboards and language sets:

Keyboard	Language	
	French	German
NRC ANSI	wy60.fra.ans	wy60.ger
NRC ASCII	wy60.fra.asc	wy60.ger
8-bit ANSI	w60.ibmfra.ans	wy60.ibm.ger
8-bit ASCII	w60.ibmfra.asc	wy60.ibm.ger

Olivetti

Use the standard mapchan files with Olivetti ws685 and ws685pc terminals.

dec	DEC Multinational
ascii	Any 7-bit US ASCII terminal

Appendix A

Hewlett-Packard

Use the following mapchan files with the HP 700/22 and HP 700/44 terminals:

Keyboard	vt220 7-bit mode NRC	vt220 8-bit mode DEC multilingual
Belgian	hp.ansi.7.bel	hp.ansi.8
Canadian French	hp.ansi.7.can	hp.ansi.8
Danish	hp.ansi.7.dan	hp.ansi.8
Finnish	hp.ansi.7.fin	hp.ansi.8
French	hp.ansi.7.fra	hp.ansi.8
German	hp.ansi.7.ger	hp.ansi.8
German (din)	hp.ansi.7.grd	hp.ansi.8
Italian	hp.ansi.7.ita	hp.ansi.8
Dutch	hp.ansi.7.ndl	hp.ansi.8
Norwegian	hp.ansi.7.nor	hp.ansi.8
Portuguese	hp.ansi.7.por	hp.ansi.8
Spanish	hp.ansi.7.spa	hp.ansi.8
Swedish	hp.ansi.7.swe	hp.ansi.8
Swiss	hp.ansi.7.swi	hp.ansi.8
British	hp.ansi.7.ukd	hp.ansi.8
American	hp.ansi.7.usa	hp.ansi.8

International UNIX Supplement

Use the following mapchan files for the HP 700/32 terminal:

Keyboard	vt220 7-bit mode NRC	vt220 8-bit mode DEC multilingual
Belgian	hp.ansi.7.bel	hp.ansi.8
Canadian French	hp.ansi.7.can	hp.ansi.8
Danish	hp.ansi.7.dan	hp.ansi.8
Finnish	hp.ansi.7.fin	hp.ansi.8
French	hp.ansi.7.fra	hp.ansi.8
German	hp.ansi.7.ger	hp.ansi.8
German (din)	hp.ansi.7.grd	hp.ansi.8
Italian	hp.ansi.7.ita	hp.ansi.8
Dutch	hp.ansi.7.ndl	hp.ansi.8
Norwegian	hp.ansi.7.nor	hp.ansi.8
Portuguese	hp.ansi.7.por	hp.ansi.8
Spanish	hp.ansi.7.spa	hp.ansi.8
Swedish	hp.ansi.7.swe	hp.ansi.8
Swiss	hp.ansi.7.swi	hp.ansi.8
British	hp.ansi.7.ukd	hp.ansi.8
American	hp.ansi.7.usa	hp.ansi.8

Note

Mapping is not required for the vt320 ISO latin1.

Appendix A

Use the following mapchan files for the HP 700/41 and HP 700/43 terminals:

Keyboard	wyse 30/50
Belgian	hp.ascii.7.bel
Canadian French	hp.ascii.7.can
Danish	hp.ascii.7.dan
Finnish	hp.ascii.7.fin
French	hp.ascii.7.fra
German	hp.ascii.7.ger
European Spanish	hp.ascii.7.esp
Italian	hp.ascii.7.ita
Dutch	hp.ascii.7.ndl
Norwegian	hp.ascii.7.nor
Latin Spanish	hp.ascii.7.lsp
Swedish	hp.ascii.7.swe
Swiss	hp.ascii.7.swi
British	hp.ascii.7.ukd
American	hp.ascii.7.usa

International UNIX Supplement

Use the following mapchan files for the HP 700/45 terminal with
ascii keyboard:

Keyboard	Wyse 60
Belgian	hp.ascii.7.bel
Canadian french	hp.ascii.7.can
Danish	hp.ascii.7.dan
Finish	hp.ascii.7.fin
French	hp.ascii.7.fra
German	hp.ascii.7.ger
European spanish	hp.ascii.7.esp
Italian	hp.ascii.7.ita
Dutch	hp.ascii.7.ndl
Norwegian	hp.ascii.7.nor
Latin spanish	hp.ascii.7.lsp
Swiss	hp.ascii.7.swi
British	hp.ascii.7.ukd
American	hp.ascii.7.usa

Appendix A

The following mapchan files for the HP 700/45 terminal with ansi keyboard:

Keyboard	vt220 7 bit mode NRC	vt220 8 bit mode DEC multilingual
Belgian	hp.ascii.7.bel	hp.ansi.8
Canadian french	hp.ascii.7.can	hp.ansi.8
Danish	hp.ascii.7.dan	hp.ansi.8
Finish	hp.ascii.7.fin	hp.ansi.8
French	hp.ascii.7.fra	hp.ansi.8
German	hp.ascii.7.ger	hp.ansi.8
German (din)	hp.ascii.7.grd	hp.ansi.8
Italian	hp.ascii.7.ita	hp.ansi.8
Dutch	hp.ascii.7.ndl	hp.ansi.8
Norwegian	hp.ascii.7.nor	hp.ansi.8
Portuguese	hp.ascii.7.por	hp.ansi.8
Spanish	hp.ascii.7.spa	hp.ansi.8
Swedish	hp.ascii.7.swe	hp.ansi.8
Swiss	hp.ascii.7.swi	hp.ansi.8
British	hp.ascii.7.ukd	hp.ansi.8
American	hp.ascii.7.usa	hp.ansi.8

Note

Mapping is not required for the vt320 ISO latin1.

International UNIX Supplement

Use the following mapchan files for the HP 700/92 terminal:

Keyboard	7 bit mode ISO REPLACEMENT	8 bit mode
Belgian	hp.ascii.7.bel	hp.roman.8
Canadian french	hp.ascii.7.can	hp.roman.8
Danish	hp.ascii.7.dan	hp.roman.8
Finish	hp.ascii.7.fin	hp.roman.8
French	hp.ascii.7.fra	hp.roman.8
German	hp.ascii.7.ger	hp.roman.8
European spanish	hp.ascii.7.esp	hp.roman.8
Italian	hp.ascii.7.ita	hp.roman.8
Dutch	hp.ascii.7.ndl	hp.roman.8
Norwegian	hp.ascii.7.nor	hp.roman.8
Latin spanish	hp.ascii.7.lsp	hp.roman.8
Swedish	hp.ascii.7.swe	hp.roman.8
Swiss	hp.ascii.7.swi	hp.roman.8
British	hp.ascii.7.ukd	hp.roman.8
American	hp.ascii.7.usa	hp.roman.8

A.5.2 Setting up a Terminal

If you have one of the terminals listed below, follow the instructions in this section to set it up:

- HP 700/99
- HP 700/44
- HP 700/41
- Olivetti ws685

Appendix A

Note that the compose character is different for some terminals configured to emulate the vt220, and with some settings of keyboard language (for example, North American). The compose character is generated by typing <CTL><Shift>/ or <CTL>7, rather than by typing <CTL>_.

HP 700/99 Terminal

If you have this terminal, set it up as follows:

- Set terminal mode to “HP”.
- Set the margin setting to “off”.
- Expand tabs to “spaces”.

HP 700/44 Terminal

If you have this terminal, set it up as follows:

- Terminal mode is EM200 with 8-bit control.
- Set the Pref. PC character set to “multilingual”.
- Set the national character set to “yes”.

HP 700/41

If you have this terminal, set the terminal mode to wy30.

Olivetti ws685

The terminal mode for this terminal is vt200 with 8-bit control.

Using International UNIX Documentation

International UNIX is available when the International Supplement is used with the SCO UNIX System V/386 Operating System. The documents which come as part of the International Supplement package and which describe how to use the International UNIX Operating System are as follows:

- The *SCO UNIX System V/386 International Supplement Release and Installation Notes*, and
- this *SCO UNIX System V/386 International Operating System Guide*.

This guide is aimed at those wishing to use the international features of International UNIX and for those administering the International Environment. The guide is designed so that each chapter can be read independently. As a result, some information may be duplicated. The chapters are as follows:

- Introducing International UNIX (this chapter)

If you are unfamiliar with SCO UNIX System V/386, first consult the *SCO UNIX System V/386 User's Guide* and then read this chapter to learn about the key features of International UNIX.

- Using International UNIX

This chapter describes how to use the international features of your UNIX operating system. It also shows how to avoid problems that may arise when working with users on non-international UNIX systems.

- Administering International UNIX

This chapter explains how to configure your system with the correct language environment, including how to install the files for setting up terminals, printers and other peripheral devices. In order to use this chapter you must be familiar with the *SCO UNIX System V/386 Operations Guide*.

Using International UNIX Documentation

- Appendix A contains copies of the following code set tables:
 - US ASCII
 - ISO 8859/1
 - HP[®] Roman 8
 - IBM[®] PC8.

What is International UNIX?

1

International UNIX aims to provide an environment in which anyone using the system does so in as natural a way as possible. There should be no need to do anything special because of a particular terminal, keyboard or language. An environment should match the customs used in the user's country for date, time and numerical formats. The way in which this environment is implemented is transparent to the user.

UNIX originated in the United States of America where the standard character set is ASCII. The number of characters (letters, numbers, symbols and control codes) in this set is 128, because the character set is only built on 7 bits. Outside America, a much larger range of characters is used, and some computer hardware manufacturers have also added graphics characters. One way of coping with these extra characters involves replacing part of the original ASCII set by the national characters (for example the accented characters); another way has been to define other standards for 8-bit character sets. The key utilities of International UNIX function with 8-bit character sets.

Allowing the use of 8-bit characters is not enough. There must be support of the character sets. Software being used on the system might be working with a number of standards for the character sets. Different programs may use different character sets. This presents a potential problem in a multi-user and multi-tasking environment, particularly if data is being used by more than one program. International UNIX overcomes these problems by defining a standard internal character set while allowing alternate character sets to be used if required.

Working in a country outside the USA involves more than just using extra characters because the language is different. Conventions vary in the use of date and currency format, and keyboard layouts can vary not only from country to country but also from terminal to terminal. It is possible that companies dealing with a number of non-English speaking countries might need more characters than can be supported on one keyboard. In order to address such requirements, International UNIX allows you to customize the user environment.

International UNIX also enables software developers to create international applications which use 8-bit character sets. Users can then run these applications in their own environment without recourse to any special configuration of the software.

Key Features of International UNIX

The following features characterize International UNIX:

- 8-bit support in kernel and key utilities.
- Modification of runtime behavior according to geographical location and language (locale). This includes:
 - national language character sets;
 - character classification (for instance, to allow for upper and lower case on accented characters);
 - time/date display (names of days, months, clock format);
 - numeric display (decimal character, thousands delimiter);
 - ordering of characters (collation) for sorting purposes and string comparison, and
 - use of international characters within regular expressions.
- Support for peripherals which allow the user to enter and display national language characters.

Utilities for International UNIX

The following utilities work with 8-bit characters and, where appropriate, their operation is affected by the setting of the locale. Refer to the appropriate manual pages for details.

at(C)	expr(C)	mv(C)	tar(C)
cat(C)	ex(C)	ncheck(C)	tee(C)
chrtbl(M)	file(C)	numtbl(M)	timtbl(M)
cmp(C)	find(C)	passwd(C)	tr(C)
coltbl(M)	finger(C)	pg(C)	ungetty(M)
cp(C)	fsck(C)	pr(C)	uucp(C)
cpio(C)	getty(M)	pwd(C)	uustat(C)

cron(C)	grep(C)	rcp(C)	uusub(C)
cu(C)	head(C)	remote(C)	uux(C)
daemon.mn(M)	ln(C)	rm(C)	vi(C)
date(C)	login(C)	rmdir(C)	wall(C)
dd(C)	ls(C)	sddate(C)	wc(C)
diff(C)	mail(C)	sdiff(C)	who(C)
diff3(C)	mestbl(M)	sed(C)	write(C)
dos(C)	micnet(M)	sh(C)	xbackup(ADM)
echo(C)	mkdir(C)	sort(C)	dumpdir(ADM)
ed(C)	montbl(M)	sysadmsh(ADM)	xrestore(ADM)
env(C)	more(C)	tail(C)	

The reference to **sysadmsh(ADM)** in the table above, includes **sysadmsh** and its subshells.

Language Environment Utilities

International UNIX uses the **mapchan** utility to perform character set mapping. More information is given in the manual page **mapchan(M)** and in the “Administering International UNIX” chapter in this guide.

International UNIX has utilities for setting up the international environment. The utilities are used to define the following:

- character classification;
- time and date display;
- character used as decimal place marker;
- collation sequence;
- currency symbol, and
- response strings for messages.

Human-readable specification files are compiled into category tables for use by the operating system and utilities with **chrtbl(M)**, **timtbl(M)**, **numtbl(M)**, **coltbl(M)**, **montbl(M)** and **mestbl(M)**. The different categories are selected by the environment variables described in **environ(M)** and **locale(M)**.

Key Features of International UNIX

locale(M)

A locale is a name used to refer to a set of national conventions that influence the behavior of library routines. These library routines perform such tasks as numeric formatting and character classification. Their actions can be varied to suit the needs of the user.

The locale is specified by a character string of the form:

language_territory.codeset

The language environment can be defined for individual users by assigning a locale string to the **LANG** environment variable in their *.profile* or *.login* files and/or as an entry in */etc/default/locale*. Refer to the **locale(M)** and **environ(M)** manual pages or the “Administering International UNIX” chapter of this guide.

environ(M)

In addition to the **LANG** environment variable, there are optional variables which permit the selection of locale attributes in any combination:

LC_COLLATE	affects collating sequence
LC_MONETARY	affects currency symbol
LC_CTYPE	affects character classification routines
LC_MESSAGES	affects the response string
LC_NUMERIC	affects numeric formatting
LC_TIME	affects time and date format.

Utilities for Creating Locale Data Files

A number of utilities are used to compile human-readable specification files for the categories used in a locale.

chrtbl(M) generates a table of characters specific to a given character classification associated with a language (for example, a file for a Spanish NRC character set). This is associated with the **LC_CTYPE** category. You only need to specify non-ASCII characters.

Key Features of International UNIX

1

timtbl(M) creates a table containing the names of the days of the week and months, and time/date formats. This is associated with the **LC_TIME** category.

numtbl(M) creates a numeric locale table containing the characters to be used as the decimal place marker (radix character) and the thousands delimiter (a comma in English format). This is associated with the **LC_NUMERIC** category.

coltbl(M) creates a table defining the ordering of characters during collation. This is associated with the **LC_COLLATE** category.

montbl(M) creates a table containing the currency symbol. This is associated with the **LC_MONETARY** category.

mestbl(M) creates a table containing the response strings a user might type in an application when prompted for a response to a yes/no answer. This is associated with the **LC_MESSAGES** category.

Introduction to Using International UNIX

International UNIX is available when the International Supplement is used with the SCO UNIX System V/386 . This chapter describes how to *use* the facilities of International UNIX. If you want to know more background information, read the preceding chapter, "Introducing International UNIX". If you want to know more about how your particular terminal and account are set up, consult your system administrator.

2

Getting the Right Characters

You may have a keyboard which allows you to input all the characters you require, or you may have to use a number of keystrokes to produce some characters. The characters you want may not all be displayed on your screen. This section describes how to use your terminal in these cases.

If you have problems, you should consult your system administrator. This documentation can only describe the ways your system might be set up; the system administrator will know how it has been set up and may be able to solve problems you are having by configuring the system especially for you.

Terminals may have a setting up facility to set the characters for your language and keyboard layout. This is either a special key called something like "SETUP", or a combination of keys. If your keyboard does not display the correct characters, check that your terminal is set correctly.

Some terminal keyboards do not have enough keys to assign one to each character. These may be 8-bit or 7-bit terminals. To enter characters which do not appear on the keyboard, either dead keys or compose sequences can be used. Dead keys generate no output when pressed but display a character when the next key is pressed; they are normally used for accented characters. Compose sequences allow you to press a number of keys to generate a particular character. International UNIX allows you to obtain international characters using special dead key and compose key sequences. Your terminal may support dead keys, irrespective of the fact that you are using it with International UNIX. It may also have a dedicated special compose key. Ask your system administrator for the methods used by your terminal. The UNIX method is described below. If it does not work exactly as described, your system administrator may have modified the sequences.

8-bit terminals can usually display most, if not all, international characters. A number of 7-bit terminals allow you to use international characters. The only way they can display these characters, however, is to substitute other characters in the 7-bit ASCII set. This means that a character you input may not appear on the screen the way you expect.

For example, in French the pipe character `|` is displayed as a `ù` on some terminals. However, the character is interpreted as a pipe character.

If your terminal does not have a particular character to display, it will display the closest approximation. For example, an á is displayed as an unaccented *a*.

Dead Key Sequences

Dead keys generate no output when pressed, but display a character when a subsequent key is pressed. This enables you to get an accented character which is not present as a specific key on the keyboard. The character is a combination of a dead key (the accent character) and the following key. For example, pressing the “” dead key followed by an *a* displays the accented character, á.

If you want to display the dead key character, press it twice.

Six dead keys are supported by the International UNIX map files. A table of map files and supported dead keys, is given in the *International Supplement Release and Installation Notes*.

Compose Sequences

Compose sequences allow you to press a number of keys to generate a particular character. The sequence starts with the compose key and is completed by two further keys, which specify the character input.

For example, the registered trade mark symbol (®) can be generated by typing the following:

<compose key> r o

Some keyboards have a compose key marked as such. To use this compose key you should refer to the manual for the terminal.

All mapping files included with the UNIX system use <CTL>_ (control underscore) as the character to introduce a compose sequence. The PC console keyboard maps also use the <Sys Req> key to introduce compose sequences; on keyboards with 12 function keys, the alternate compose key is the * on the number pad.

The compose sequences supplied with UNIX have alternatives. This is because some sequences are needed to cover the cases where characters are not present on the keyboard and so cannot be used as part of a compose key sequence.

Getting the Right Characters

The following characters have not been used as elements of the minimal compose sequence, since they are not present on certain keyboards:

`# $ @ [\] ^ _ { | } ~ .`

A table showing all characters that can be entered by means of compose sequences may be found in the chapter “Administering International UNIX”, in the section “Compose Sequences”. The compose sequences have been designed so that you can enter all characters in the ISO 8859 character set on terminals and keyboards supporting 7-bit ASCII. All mapping files recognize all compose sequences.

Working Internationally

International UNIX has features which allow UNIX to be configured for the country in which you are working, and allow software to use the configuration automatically. This section describes how to use the features.

2

Locales

International UNIX has a feature for configuring the environment in which you work so that your national and personal requirements are met. Configuration is achieved by setting up the requirements in a set of tables which define the locale. Applications software will then operate according to the conventions configured for a specified locale. You can set:

- your time/date format;
- your numeric display format;
- your currency symbol;
- your message for yes/no responses;
- your collation sequences for sorting, and
- the way special language characters are treated as upper or lower case or as punctuation.

Some of these would only be set one way for your country and character set. Others you may wish to have set for your personal preferences or for the way in which you work. For example, you may work in dollars even though your country is in Europe. You may wish to have the date shown in a different format than that of other users on the system and keep the time format the same.

Consult your system administrator to set the locale for your requirements.

Working with International Characters

International UNIX allows you to work with international characters as you would standard English characters. There are three key areas where international characters must be handled:

1. character classification and conversion;
2. ordering (collation) sequences, and
3. correct regular expressions (ranges).

Character classification allows characters to be treated as you would expect them to be treated in your language. For example, in Germany you expect Ä to be treated as an uppercase letter and in France é as lowercase.

When you sort or order a string of characters, you expect the accented characters to be treated in a similar way to their unaccented counterparts. For example, you might expect them to be ordered close to the same characters without the accent, rather than after "z".

International UNIX also handles special cases of ordering, by setting up the collation sequences as part of the locale. For example, in German the character ß corresponds to a double s, and in Spanish the "ch" characters represent a single sound.

The commands which use regular expressions as part of their syntax also comply with the rules used in a particular country.

Correct Collation

When you sort words, International UNIX sorts according to the collation sequence in your environment. The most common situation in which you are likely to be sorting is using the `ls` command. If you have filenames or directory names which have international characters in them, they will be displayed in an order which takes the international characters into account.

There are different conventions for sorting by character, depending on the language used and the function of the sort. If the sort is not correct for your needs, ask your system administrator if it can be modified.

Using Regular Expressions

If you are using regular expressions you can use the expanded options to take account of international characters. The manual page for `ed(C)` gives full details of the use of regular expressions.

Potential Problems

Working in an environment with 8-bit characters and international features may present some problems. This section gives guidelines for avoiding such problems.

Avoiding 8-bit Names

UNIX files are often exchanged with other machines, either using networking facilities, through electronic mail or on magnetic media in **tar** format.

Names which contain 8-bit characters cannot be used by 7-bit systems. Do not use 8-bit characters when naming machines, users, files and directories. Use only 7-bit ASCII characters.

The C shell does not handle 8-bit characters. If you try to use 8-bit characters in commands, a message is normally displayed asking you to logout. If you wish to use 8-bit characters in commands, use the Bourne shell.

Mail and 8-bit Characters

If you use 8-bit characters in files and send them to a user on another system which is not using International UNIX and is only using 7-bit characters, the user will not be able to display the characters.

This would also happen if your user name or machine name contained an 8-bit character. A user on a 7-bit system would not be able to send any messages to you because he/she could not input the 8-bit character in the address.

File Transfer and 8-bit Characters

If you are transferring files by floppy, tape, **uucp** or other network connection, to a system that uses only 7-bit characters, ensure that file and directory names do not contain 8-bit characters. Failure to observe this could cause problems with the manipulation and display of such files and directories.

Introduction

The system administrator can customize International UNIX to conform to a number of language standards. Individual users can use terminals configured for different languages. A number of language environments are included with the UNIX system and new ones can be created using system utilities.

A language environment is defined both in terms of language and nationality. It consists of national standards for a given country (for example, date and time format and numerical display standards) and peripheral device configuration to meet character set standards for that country. Under International UNIX, a language environment is made up of a number of locale variables and character mapping for peripheral devices. A language environment is defined for the system and for individual users.

3

This chapter explains how to configure peripheral devices such as terminals and how to choose or create a language environment for your system. Also covered are the special considerations needed to use the **mail**, **write** and **uucp** utilities on a system configured for use with multiple languages.

The steps required to set up and maintain the international environment are:

- Terminals and printers need to be configured, both with their own setup procedure and with the correct **mapchan** files.
- The system must work with a consistent internal character set.
- Users need to have their environments set so that date, time, currency and numerical output meet their requirements.
- Collation sequences need to be set so that sorting and use of regular expressions proceeds correctly.
- If a mixture of 7 and 8-bit software is being used, the users must be aware of how to use both types together.

Before Configuring Devices

Terminals consist of a keyboard and screen which, together, are seen by UNIX as an intelligent entity. The console is two separate devices (keyboard and screen) and so requires a different type of configuration. Printers simply accept characters. This means that there may be a number of different types of device attached to the system using different character sets. Setting up the international environment relies on having a standard character set and referencing all devices to this character set. This requires mapping of characters to the internal character set. If a device supports the internal set directly, mapping may be minimal or not required at all.

The Internal Character Set

The ASCII standard is a 7-bit standard. It supports the USA English character set. Other languages have extra characters, although the UK English set differs only in the currency symbol. There are a number of extensions to the ASCII set which provide 8-bit support and characters for a wide range of languages using Roman characters and, in some cases, graphics characters.

The two most common standards of extended ASCII character sets are the ISO 8859 set and the IBM PC character set. The recommended internal character set for UNIX applications is the ISO 8859 standard because it supports the widest range of international characters. All SCO international software is designed to use this set.

Mapping using the **mapchan** utility allows you to set standard by the ISO 8859 set. A number of mapping files are provided, and you can write your own to suit your circumstances.

Note

As there are no Greek characters in the ISO 8859 character set, the Greek mapping file does not conform to this standard. For Greek, the internal character set is a special Greek character set. Only the first 128 characters of this set match the ISO 8859 set.

Before Configuring Devices

Your UNIX system can be configured to select, on system startup, the correct map file for each peripheral device. This is described in the section on “Setting up a Terminal”. The keyboard layout for the system console is configured with the **mapkey** utility as shown in the section “Keyboard Mapping for the Console.”

The following section describes the concept of character mapping and how to make your own map files.

Character Mapping

Character mapping using the **mapchan** utility works by filtering or translating character sets between the internal character set and the devices on the system. Information entered at the keyboard is converted from SCAN code (code which reflects the coordinates of keys pressed at the keyboard) into ASCII code.

The following diagram shows the flow of information:

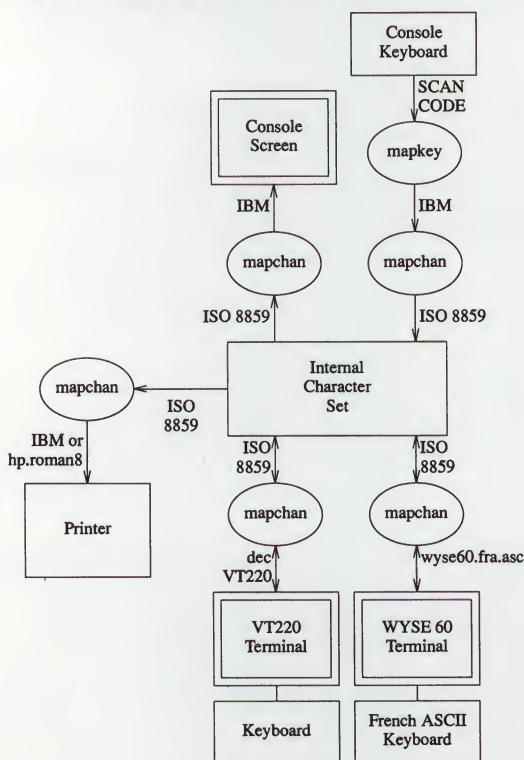

Figure 3.1 Character Mapping

Using Character Mapping

Certain characters in the ISO 8859 character set are not assigned to specific keys since most terminals do not have enough keys to assign one to each character. The UNIX system provides two methods to enter these characters: dead keys and compose sequences.

Dead Key Sequences

A dead key generates no output when pressed, but displays a character when a subsequent key is pressed. Such a key can give you an accented character which is not present on the keyboard as a specific key. The character is a combination of a dead key (the accent character) and the following key. For example, pressing the “” dead key followed by an *a* displays the accented character á.

3

To display the dead key character, press it twice.

Six dead keys are supported by the International UNIX map files. A table of map files and supported dead keys is given in the *International Supplement Release and Installation Notes*.

The following tables show which characters can be produced using the dead keys. There are six tables, each corresponding to a dead key. The *second key* is the key to press after pressing the dead key; the *value* is the hexadecimal value of the *resulting character*.

Characters available with the Caret Dead Key (^)		
Second Key	Value	Resulting Character
a	0xe2	â - a caret
A	0xc2	Â - A caret
e	0xea	ê - e caret
E	0xca	Ê - E caret
i	0xee	î - i caret
I	0xce	Î - I caret
o	0xf4	ô - o caret
O	0xd4	Ô - O caret
u	0xfb	û - u caret
U	0xdb	Û - U caret
SPACE	0x5e	^ - caret
^	0x5e	^ - caret

Character Mapping

Characters available with the Umlaut Dead Key (¨)		
Second Key	Value	Resulting Character
a	0xe4	ä - a umlaut
A	0xc4	Ä - A umlaut
e	0xeb	ë - e umlaut
E	0xcb	Ë - E umlaut
i	0xef	ï - i umlaut
I	0xcf	Ï - I umlaut
o	0xf6	ö - o umlaut
O	0xd6	Ö - O umlaut
u	0xfc	ü - u umlaut
U	0xdc	Ü - U umlaut
y	0xff	ÿ - ij ligature
SPACE - umlaut		
¨	0xa8	¨ - umlaut

Note

Some keyboards have an umlaut key. This is not the same as the double quote character, which is often used to represent an umlaut/dieresis.

Characters available with the Acute Dead Key (´)		
Second Key	Value	Resulting Character
a	0xe1	á - a acute
A	0xc1	Á - A acute
e	0xe9	é - e acute
E	0xc9	É - E acute
i	0xed	í - i acute
I	0xcd	Í - I acute
o	0xf3	ó - o acute
O	0xd3	Ó - O acute
u	0xfa	ú - u acute
U	0xda	Ú - U acute
y	0xfd	ý acute
Y	0xdd	Ý acute
SPACE	0xb4	´ - acute
´	0xb4	´ - acute

Characters available with the Grave Dead key (`)		
Second Key	Value	Resulting Character
a	0xe0	à - a grave
A	0xc0	À - A grave
e	0xe8	è - e grave
E	0xc8	È - E grave
i	0xec	ì - i grave
I	0xcc	Ì - I grave
o	0xf2	ò - o grave
O	0xd2	Ò - O grave
u	0xf9	ù - u grave
U	0xd9	Ù - U grave
SPACE	0x60	` - grave
`	0x60	` - grave

3

Characters available with the Tilde Dead Key (~)		
Second Key	Value	Resulting Character
a	0xe3	ã - a tilde
A	0xc3	Ã - A tilde
o	0xf5	õ - o tilde
O	0xd5	Õ - O tilde
n	0xf1	ñ - n tilde
N	0xd1	Ñ - N tilde
SPACE	0x7e	~ - tilde
~	0x7e	~ - tilde

Note

Not all mapfiles support the ñ and Ñ characters.

Characters available with the Cedilla Dead Key (,)		
Second Key	Value	Resulting Character
c	0xe7	ç - c cedilla
C	0xc7	Ç - C cedilla
SPACE	0xb8	, - cedilla
,	0xb8	, - cedilla

Character Mapping

Compose Sequences

Compose sequences allow you to press a number of keys to generate a particular character. The sequence starts with the compose key and is completed by two further keys, which specify the character input.

For example, the registered trade mark symbol (®) can be generated by pressing the following:

<compose key> r o

Some keyboards have a compose key marked as such. To use this compose key you should refer to the manual for the terminal.

All mapping files included with the UNIX system use <CTL>_ (control underscore) as the character to introduce a compose sequence. The PC console keyboard maps also use the <SysReq> key to introduce compose sequences; on keyboards with 12 function keys, the alternate compose key is the * on the number pad.

The compose sequences supplied with UNIX have alternatives. This is because some sequences are needed to cover the cases where characters are not present on the keyboard and so cannot be used as part of a compose key sequence.

The following characters have not been used as elements of the minimal compose sequence, since they are not present on certain keyboards:

\$ @ [\] ^ ' { | } ~ .

The following table shows all the characters available with the various compose sequences:

Character Mapping

Character	Value	Compose Sequences			
compose key value	0x1f	--			
# - hash	0x23	++			
\$ - dollar	0x24	s /	S /	S l	s l
@ - at sign	0x40	A A	a a		
- vertical bar	0x7c	/ ^	/ <		
[- left bracket	0x5b	((
\ - backslash	0x5c	//			
] - right bracket	0x5d))			
^ - caret	0x5e	> <			
` - grave	0x60	' <			
{ - left brace	0x7b	(-			
} - right brace	0x7d) -			
~ - tilde	0x7e	= =			
no break space	0xa0	SP SP			
¡ - inverted !	0xa1	!!

þ - lowercase thorn	0xfe	p l	t h		
ÿ - ij ligature	0xff	y "			

Creating mapchan Files

It may be necessary to modify the **mapchan** files provided to cater for new items of hardware, or software which require character sets other than ISO 8859. Typical examples of the way **mapchan** files are written, are given below.

Input Section

A typical example of how the input section is used is on the console. In this case, the input section of the mapping takes the input from **mapkey**. The **mapkey** output generates the 8-bit PC code set characters. If you want to use the IBM character set, no mapping is required with the exception of one character. If you have the ISO 8859 set as the internal character set, then you need to map the 8-bit characters.

The exception, when using IBM characters, is the entry for the section symbol, §. The keyboard map does not generate the 8-bit PC code for this character. This is because it has the same code as <CTL>U which UNIX would treat as a command to clear the line. It is mapped into the code 0xb2. The new **mapchan** file needs to translate this back to the 8-bit PC code.

The input section will be:

```
input
0xb2 21  # restore the section symbol
```

A # character denotes a comment.

Output Section

The console display understands 8-bit IBM PC characters. The paragraph, section and cent symbols use codes which have a special meaning to the UNIX console driver. To make them print, they must be translated to graphic escape sequences.

3

The output section will be:

```
output
20  0x1b '[' '2' '0' 'g'      # paragraph sign
21  0x1b '[' '2' '1' 'g'      # section sign
155 0x1b '[' '1' '5' '5' 'g'  # cent sign
```

If you were simply mapping from an ISO 8859 character set to the IBM set, typical characters might be:

```
output
0xc0  'A'  # use A since no A grave available
0xc4  0x8e  # A umlaut
```

The **mapchan** files have been written so that the closest displayable character is used where a character is not available.

Dead Key Section

The dead key section maps the characters for each dead key. Typical mappings for a dead key for caret characters using ISO 8859 might be:

```
dead  0xb0  # declare the caret character
'a'    0xe2  # character for a with caret
'e'    0xea  # character for e with caret
```

Character Mapping

Compose Key Section

The compose key section has a structure like the dead key section of declaring the compose key then a list of the characters to be mapped. In all cases there are two characters following the compose key. For example, mapping compose keys within the 7-bit range of characters common to ASCII, ISO 8859 and IBM character sets:

```
compose 0x1f # compose key is ^_
' _ ' _ ' 0x1f # output the compose key value
' + ' + ' # ' # ' # two + characters generate a #
```

Control Section

This section allows for context-sensitive mapping problems, where **mapchan** might change characters which should not be changed. For example, the screen cursor on a terminal may be positioned by an escape control code (0x1b) followed by a number of other characters. If one of the characters is changed by **mapchan**, then the escape code sequence will be incorrect; the cursor will appear at the wrong place on the screen. The control section of **mapchan** enables a specific number of characters to be ignored by **mapchan** which form part of a terminal escape sequence. Some function keys generate a control sequence which can be handled similarly. The following control section shows some typical sequences:

```
CONTROL
input
^A      1  # Function keys: ^A followed by one
          character
\E      1  # Function keys: Escape followed by one
          character

output
\Ea     4  # cursor control: Escape a and 4 other
          characters
\EG     1  # set attributes: Escape G and one
          character
```

Setting up a Terminal

Setting up a terminal is a two stage process.

1. Use the built-in terminal setting up procedure to set the language and keyboard layout.
2. Assign the correct **mapchan** file to that terminal.

In the installation of International UNIX you were asked if you wished to install a common channel map for all the terminals. If you did this and the terminals are not the same, you must edit the file */etc/default/mapchan* for the correct entry against each terminal. If you did not select a common map, you may need to either edit the file to choose a particular one of the set provided or your own.

3

mapchan files are supplied for a number of different devices. All files are in the directory */usr/lib/mapchan*. The *International Supplement Release and Installation Notes* gives a table of the **mapchan** files for the various devices.

Screen Font Mapping for the Console

You can display the full range of characters on a display adapter by using the **vidi(C)** utility. Normally, if you have a console with a display adapter which has a character set defined in a ROM, you will be able to display only those characters defined in that ROM. In addition, the **mapchan** file for the console must correspond to the character set defined in the display adapter ROM to display the entire font set.

For example, if your display adapter ROM has the IBM PC character set defined, but you are using the PC Nordic **mapchan** file, you will not be able to display the following characters:

ø Ø Æ ı ö õ ã Ä

To display these characters, use the **vidi(C)** utility to override the character set in ROM with the PC Nordic font file.

In addition to using **vidi(C)** to override ROM, you can use it to define certain display fonts on some display adapters. For example, the VGA adapter will allow you to display fonts in the sizes 8x8, 8x14, and 8x16.

Setting up a Terminal

If you change **mapchan** mapping for a console with any type of display adapter, you will also need to change the character font correspondingly.

The **vidi(C)** utility defines the font for one of a number of character sets. The font definition files are available in the directory */usr/lib/vidi*, and are listed in the *International Supplement Release and Installation Notes* for the various character sets.

For example, the following command allows you to display the full range of Nordic characters when you are using the PC Nordic **mapchan** file and your display adapter ROM has the IBM PC character set defined:

```
vidi -f /usr/lib/vidi/nor.8x14 font8x14
```

Keyboard Mapping for the Console

The keyboard of the console operates independently from the screen. This is because of the way it generates the characters using scan-codes. The keys of the system console are mapped using the **mapkey** utility, which applies only to the console and allows you to configure your console to use keyboards other than the standard US keyboard.

The function of **mapkey** is separate from that of **mapchan** in that the console keyboard should generate character codes in the form understood by the console display. This is most often the PC 8-bit code set, not the ISO 8859 8-bit code set.

mapkey files are supplied for various PC-AT and PS/2 style keyboards. The keyboard file that should be used is also influenced by the character set used by the console screen. All the keyboard files can be found in the */usr/lib/keyboard* directory and are listed in the *International Supplement Release and Installation Notes*.

These **mapkey** files map the console keyboard to meet the given national standard. The **mapkey** file for a particular national standard may need to be modified for a specific keyboard. If you want to change the key map, link or copy the **mapkey** file appropriate for your keyboard to the file */usr/lib/keyboard/keys*, so that it is accessed when **mapkey** is called with no arguments.

Setting up a Printer

Setting up a printer is much the same as setting up a terminal. The line to which the printer is attached should have the appropriate map file assigned to it in */etc/default/mapchan*. The map file is also assigned to the parallel line, if this is used, instead of one of the serial lines.

mapchan files are supplied for specific devices, although any **mapchan** file can be used if suitable. All files are in the directory */usr/lib/mapchan* and are listed in the *International Supplement Release and Installation Notes*.

Choosing a Locale

After configuring the peripherals, you should set the locale for each user. The installation only sets up a system-wide default. You may wish to set different locales for different users. This section describes the options available and how to use them.

Different countries use different language characters, alternate formats for showing the date and time, and different ways of displaying numbers. Not only do they use different currency symbols, but also place the symbol in a different place.

For example, consider some differences between the United States and Germany:

ITEM	US	GERMANY
time	12:23:02 PDT	23:23:02 MEZ
date	12/6/87	6.12.87
characters	brothers	brüder
codeset	ASCII	ISO 8859
currency	\$100	50DM
affirmative reply	yes	ja
negative reply	no	nein

The extra characters mean software has to sort in a different way. For example, the accented characters are not automatically grouped with their upper and lower-case unaccented counterparts in character sets with these extra characters.

Individual users may wish to define their own mixtures of formats. In International UNIX users can have an environment consistent with their own needs. By inspection of the locale, software can set the locale-dependent information according to the user's requirements. The system administrator only has to configure a user's environment, not each piece of software.

Choosing a Locale

In order to configure the environment, software has to be directed to the correct information. This is done by means of directories located in */usr/lib/lang*. At the bottom of the hierarchy are the files containing the information for the various locales:

<i>ctype</i>	special language characters and their attributes (case punctuation etc.)
<i>time</i>	time/date format
<i>numeric</i>	numeric display format
<i>currency</i>	currency symbol
<i>messages</i>	message for responses
<i>collate</i>	collation sequences

3

These six category files are indexed by the locale string, which has the following format:

language_territory.codeset

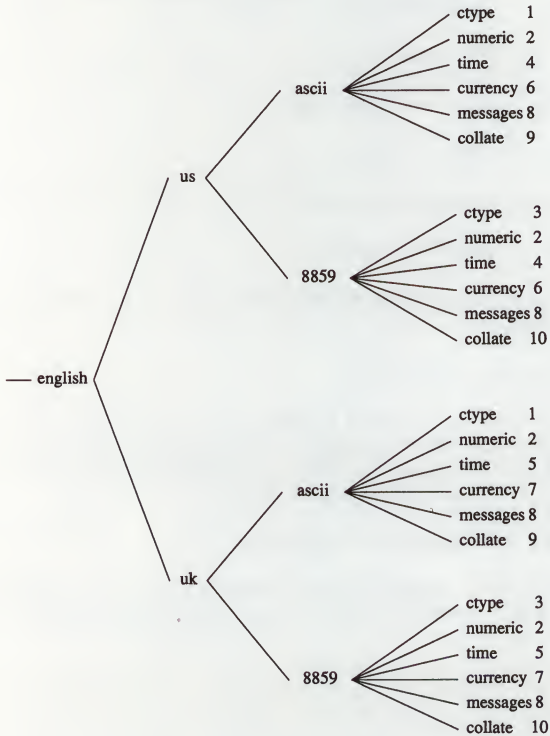

The underscore and dot are used as delimiters for the field names when passing them to environment variables. During program startup, the run-time library converts the locale format into a directory name where the necessary files for each category can be found:

/usr/lib/lang/language/territory/codeset

The names of the directories *language*, *territory* and *codeset* (character set) are arbitrary, although it is best to stick to the convention given in **locale(M)**.

Choosing a Locale

When you install International UNIX, a set of files is installed for you. The one for the English language, divided into USA and UK territories, using ASCII and ISO 8859 codes is located under the directory */usr/lib/lang* and looks like this:

1	7-bit ASCII character classification table
2	U.S. and U.K. numeric format
3	8-bit ISO 8859/1 character classification table
4	U.S. English date/time format
5	U.K. English date/time format
6	U.S. currency format
7	U.K. currency format
8	English yes/no strings
9	7-bit ASCII collation table
10	8-bit ISO 8859/1 collation table

(The full pathname for a table file would be expressed: */usr/lib/lang/language/territory/codeset/category*.) The default system environment can be set using the **LANG** environment variable in the file */etc/default/lang*, according to the *language_territory.codeset* convention. For example:

```
LANG="english_uk.8859"
```

This would set the locale to the English language in the United Kingdom, using the ISO 8859 character set.

It is also possible for each user to define their own locale by setting variables in their own environment, as described in the next section.

Using Environment Variables

The locale can be specified in */etc/default/lang* or the user's login file (for example *.login* or *.profile*) by setting the **LANG** environment variable. The format of the locale string is the same as for the system default.

Individual categories can be affected independently using the optional environment variables:

- **LC_CTYPE**
- **LC_NUMERIC**
- **LC_TIME**

Choosing a Locale

- `LC_MONETARY`
- `LC_MESSAGES`
- `LC_COLLATE`

Note that the environment variable is the same as the actual category name with the initial `LC_` prefixed.

Thus it is possible to combine the attributes of different locales to suit the needs of the user. For example, a French character set can be used with time/date and numeric display consistent with that of the United States.

The user environment is changed by assigning a new value to a variable. In the case of a user specifically needing the United States time/date format, set the `LC_TIME` variable in the user's *.profile* or *.login* file. The system-wide default language is set by the value in */etc/default/lang*:

```
LANG=french_france.8859
```

For the Bourne shell, an assignment has the form:

```
name=value
export name
```

Add the following lines to the *.profile* file to specify the date/time for the user:

```
LC_TIME=english_us.8859
export LC_TIME
```

For the C shell, the environment is changed with:

```
setenv name value
```

Add the following line to the *.login* file to specify the date/time for the user:

```
setenv LC_TIME english_us.8859
```

Note that it is not necessary to specify the complete locale string. For example, if you specify the *language* field the others will be taken from the defaults in */etc/default/lang*.

For example, if you specify the following:

```
LANG=english
```

the other fields will be taken as the defaults from */etc/default/lang*. See **locale(M)** for more details.

Creating a New Locale

So far the assumption has been made that it is possible to select a locale from the existing hierarchy. Since only a limited number of locales are provided with International UNIX, you may wish to create new locales to suit your needs.

3

For this purpose, several facilities are provided:

- **chrtbl(M)**: creates a *c*type (character classification) table
- **numtbl(M)**: creates a *n*umeric (decimal and thousands delimiter) table
- **timtbl(M)**: creates a *t*ime (day/month names and date/time format) table
- **monttbl(M)**: creates a *c*urrency (symbol and position) table
- **mesttbl(M)**: creates a *m*essage (response string) table
- **coltbl(M)**: creates a *c*ollate (collation) table

Each has a specification file format associated with it, representing the “human-readable” form of the table. These utilities are then used to compile the table into a machine-readable form that can be placed into the established locale hierarchy. The subsections that follow explain how to use each of the table compiling facilities and their file formats to create new locales.

chrtbl(M)

chrtbl generates a table of the attributes of characters associated with a language. Since the basic ASCII character set is already defined and used by the system, only the additional characters required need be specified. The attributes allow software to decide whether a character is upper or lower case, whether it is a control character or a numerical digit, and so how to treat it.

Choosing a Locale

The table uses three columns of data: *char*, *type* and *conv*. *char* refers to the character itself, represented in any of the following ways:

65	decimal
0101	octal
0x41	hexadecimal
'A'	quoted character
'\101'	quoted octal
'\x41'	quoted hexadecimal

type relates to the classification of the character (that is whether it is uppercase, lowercase, punctuation, etc.).

The following characteristics can be combined to represent any legitimate character (for example "UL" for a dual case letter):

C	control character
D	digit
L	lowercase
P	punctuation
S	space
U	uppercase
X	hex digit

conv is simply an optional field specifying the corresponding uppercase or lowercase form of the character being defined.

All characters on a line following a # character are ignored. These are "comments".

The following lines, form part of a *ctype* specification file for a German NRC character set, show how such a table is set up:

```
# chrtbl source file for 7-bit ISO German characters
#
0x40 P                # paragraph sign
0x5b U                # A umlaut
0x5c U                # O umlaut
0x5d U                # U umlaut
0x7b L                # a umlaut
0x7c L                # o umlaut
0x7d L                # u umlaut
0x7e UL              # sharp ss
```

timtbl (M)

timtbl creates a table containing the names of the days of week, month, and time/date formats. Apart from the order in which the date and time are printed, it also allows specification of the name of the day and month, in full and abbreviated forms. For full details of the parameters, see the manual page, **timtbl(M)**.

Part of a typical *time* specification file would look like the following. The format is explained by the comments on the right.

```
#
#   Example timtbl specification file for
#   english_uk.ascii
#
DATE_FMT="%m/%d/%y"          # 22/04/87
TIME_FMT="%H:%M:%S"          # 14:43:40
D_T_FMT="%a %b %d %X %Z %Y"  # Wed Apr 22 14:43:40
                                GMT 1989
DAY_2="Monday"               # full second day
ABDAY_1="Sun"                # abbreviated first day
MON_3="March"                # full month
ABMON_4="Apr"                # abbreviated month
```

3

Special characters may be included in the string using the “\” prefix. This may be followed by 1, 2 or 3 digits specifying a character value in octal, “x” or “X” followed by 1 or 2 digits, specifying a character value in hex, or any other single character, such as “” or “\” itself, which is copied directly to the string.

numtbl (M)

numtbl creates a numeric locale table containing the characters to be used as the decimal place marker (radix character) and the thousands delimiter (a comma in English). The specification file requires only two lines:

```
DECIMAL='.'
THOUSANDS=','
```

The characters can be specified in any of the forms discussed for *ctype* (for example hexadecimal or quoted character).

Choosing a Locale

montbl (M)

The **montbl** specification file defines not only the currency symbol, but also its position relative to the numeric value. The specification file requires only one line. For example, the following defines the DM characters to come after the value:

```
CRNCYSTR="+DM"
```

The characters can be specified in any of the forms discussed for **timtbl** (for example hexadecimal or quoted character).

mestbl (M)

The **mestbl** specification file defines the response strings which an application may expect a user to type when presented with a prompt requiring a yes/no answer. The specification file requires only two lines. For example, the following lines define the German positive and negative responses:

```
YESSTR="ja"  
NOSTR="nein"
```

The application software may decide just to allow the first character of each of these words as a response.

The characters can be specified in any of the forms discussed for **timtbl** (for example hexadecimal or quoted character).

coltbl (M)

The **coltbl** specification file defines the format for the ordering of characters during collation. Make definitions for the characters using one of the following keywords:

```
PRIM:  
EQUIV:  
DOUBLE:  
ZERO:
```

For example a typical file might contain a section containing the primary characters as follows:

```
PRIM: 'A' 0xc4 'a' 0xe4
PRIM: 'B' 'b'
PRIM: 'C' 'c'
PRIM: ('C' 'H') ('C' 'h') ('c' 'h')
PRIM: 'D' 'd'
PRIM: 'E' 'e'
PRIM: 'F' 'f'
```

The collation order is defined by the relative position of the line in the file, and by the position of the character in the line. Thus all characters in a line are equal in the primary sort, but their position in the line is used when the second or subsequent passes have to be made.

3

Characters which are sorted together, such as “ch” in Spanish, can be specified as a joint character. This is not the same as a character such as the German sharp s, ß, which is defined as two characters for collation purposes with the definition:

```
DOUBLE: 0xdf = ('s' 's')
```

If it does not matter which of two characters has precedence you can make them equal. Thus, if the collation sequence had an entry:

```
EQUIV: 'p'='q'
```

then p and q would be considered as equal during string comparison operations.

Characters can be ignored during collation by using the ZERO: keyword. For example, to ignore the “-” character, use:

```
ZERO: '-'
```

In making a collation sequence, all characters in the character set must be specified. In order to minimize the work involved in constructing such a table, ranges may be specified. Thus, a range of punctuation can be ignored by specifying the following line:

```
ZERO: 0x20 - 0x2f
```

Choosing a Locale

Compiling and Installing Data Tables

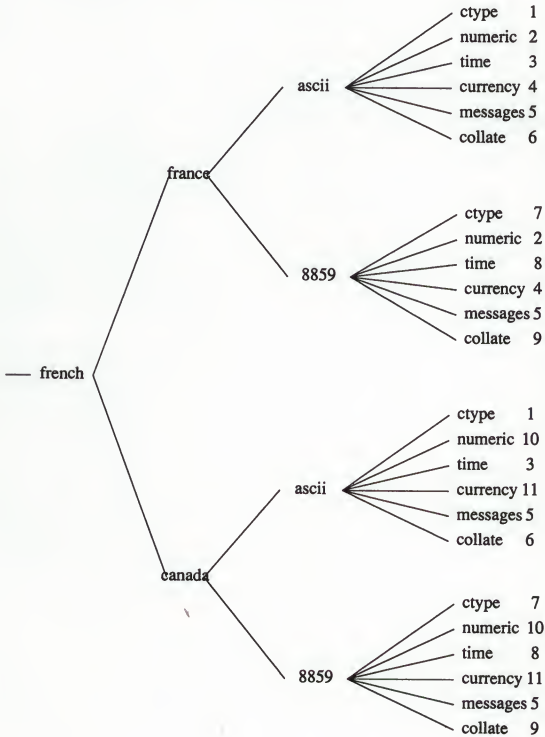

In preparing the category files, you use an editor such as `vi`. Then use the appropriate table utility to generate a file (in the current directory) with the proper filename ready for installation in the appropriate directory structure. The command line for compiling a specification table consists of the command followed by the name of the specification file. For example, the following command generates the file *time*:

```
timtbl time.spec
```

Copy this file to the position in the locale file hierarchy where you want it to be accessed.

Choosing a Locale

The table file for a given category may appear in more than one locale; link the files in such an instance. An example of such a series of files for the French language and the territories that apply might look like the following. Category files for currency, messages and collation have been omitted to simplify the diagram.

Choosing a Locale

For clarity, the category files have been numbered since all have the same names at the bottom of the hierarchy. In this case they are:

1	7-bit ASCII character classes
2	Continental European numeric format
3	French language time/date format (unaccented/7-bit)
4	French Franc currency format
5	French language yes/no responses
6	ASCII machine collation sequence
7	ISO 8859/1 character classifications
8	French language time/date format (accented/8-bit)
9	ISO 8859/1 Dictionary order collation sequence
10	North American numeric format
11	Canadian Dollar currency format

The System Administrator and 8-bit Characters

Administrating an environment with 8-bit characters and international features may present some problems. This section gives guidelines for avoiding such problems.

Choosing the Correct Shell and Utilities

3

Many system administrators use the C shell for its added features such as the history feature. No 8-bit version is provided, so you may need to use the Bourne shell.

Using the C shell may not cause any problems, provided you do not use 8-bit characters on the command line. They will normally result in a message telling you how to logout.

Switching mapchan Off and On

A number of cases will arise when you will have to switch **mapchan** off and on:

- When you as system administrator are creating and testing **mapchan** files.
- When using 7-bit software. More detail is given in the next section.
- When a user has to work on a terminal which is configured in a different way from his/her own terminal. This might be when you have a mixture of language environments or if a terminal goes down and is replaced on a temporary basis.

To switch **mapchan** off use the command:

mapchan -n

To switch it on use:

mapchan -f *mapfile*

The System Administrator and 8-bit Characters

where *mapfile* is the path and filename of the mapping file you wish to use.

Using 7-bit Software

Before the arrival of 8-bit code sets, as used by International UNIX much native language software was written using 7-bit code sets with some of the ASCII codes replaced by national variants such as accented characters. Such software has often been written for a particular terminal type. The software may not have a substitute 8-bit version and have to be run in conjunction with other 8-bit software. Using the 7-bit software with **mapchan** will cause problems over the confusion of characters. The **mapchan** filtering should be switched off when the 7-bit software is running.

To do this, make a shell script for each program, which switches **mapchan** off, runs the program and then resets **mapchan** on exiting from the program. You need to make a series of scripts for each program. Also, if you have a number of users who have different **mapchan** configurations, you will have to make individual scripts for each of them. A typical small script for a program called *seven*, which saves and then restores the current mapping, would be:

```
tmpfile=/tmp/map$$  
trap "rm $tmpfile" 0 1 2 3 15  
mapchan > $tmpfile  
mapchan -n  
seven  
mapchan -f $tmpfile
```

Converting Files with trchan

There are situations where you may have files which need translating between different character sets. Examples of such cases are:

- files which were written under 7-bit software which do not conform to the ISO 8859 character set;
- files generated by software using IBM characters which you need to use with a program using ISO 8859 characters (see notes below), and
- output which you need to use with a device which uses a different character set, for example a printer.

The System Administrator and 8-bit Characters

In all of these cases you can use the **trchan** utility which acts in the same way as **mapchan** and uses the same mapping files. The following examples show how you might use **trchan**.

Suppose you have a file to print which was saved in IBM characters, and you normally save in ISO 8859 characters. Also, you normally print on a Hewlett-Packard LaserJet using the Roman8 character set using **lpr** using the command:

lpr filename

You would have **mapchan** set with a default mapping to convert ISO 8859 characters to the Hewlett Packard LaserJet Roman8 character set. This mapping expects ISO 8859 characters. Use **trchan** to convert the IBM characters to ISO 8859 characters before sending it to the printer, with the command:

trchan -i /usr/lib/mapchan/ibm <filename | lpr -dhp

where *filename* is the file you are printing and *hp* is the name assigned to the printer.

You might use this method for shared printers were it is not convenient to turn off **mapchan**.

Converting files to work with different programs can be tackled in a number of ways. If you are going to use the mapfiles provided, you must save the text without any of the features such as emboldening or underlining. There may be a feature which allows you to save text as straight text. Alternatively, if you need to keep the formatting, you can write a special mapfile to convert the formatting codes.

Mail and 8-bit User Names

The version of **mail** supplied with UNIX (MMDF mail) does not allow 8-bit characters in the address fields of the header, although they are allowed in the message itself.

If a user with an 8-bit character in his/her user name tries to send mail, the mailer will refuse to send the message, even if the intended receiver does not have 8-bit characters in his/her name. Similarly, **mail** will refuse to send any messages to users with 8-bit characters in their usernames. Because of this, it is advisable not to create usernames containing 8-bit characters.

The System Administrator and 8-bit Characters

Write(C) and 8-bit Characters

The version of **write(C)** supplied with UNIX has been modified, for reasons of security, to prevent a user from sending non-ASCII, non-printing characters to another user's terminal.

This means that unless a user has the *terminal* subsystem authorization, he/she cannot use **write(C)** to send 8-bit characters to another user's terminal. See **subsystem(M)** for details.

Appendix A
